

## Urban Developments

Adding the finishing touch to the rebirth of a town centre

***Harlow town centre has been virtually completely rebuilt in recent years. Constructed at a time when concrete was widely used in most applications and suffering from the effects of this the original town centre had been showing its age for some time.***

The council decided to redevelop the retail district, building purpose-designed modular retail units to give the area a clean and modern image for the 21st century.

Through sister company CA Roofing Services, CA Building Products supplied a wide variety of materials for a number of applications within this exciting development.

Aluminium composite material flat panels in metallic silver give building fronts a crisp and spacious feel, while cappings and trims in 2mm powder coated aluminium add the perfect finishing touch.

CA also supplied and installed wall cladding, louvres and rainwater goods.

In addition, the roofs for units housing high street giants like HMV, Next and Woolworths, were achieved using Twin-Therm® built-up, non-combustible metal roof and cladding system.
